Ørsted Services A/S, AI, Data & Architecture Platform, Gentofte

Re: Senior Lead Enterprise Architect (job 32799)

Dear Hiring Team,

I am applying for the Senior Lead Enterprise Architect role because it describes the work I enjoy most: turning complex business needs and many stakeholders into a clear target state and making sure they are delivered. For a decade I have done this across the Danish public and private sectors, acting as the bridge between business owners, delivery teams and external suppliers. Today I shape shared infrastructure that Danish municipalities rely on every day. Helping build the technology foundation behind Ørsted's vision of a world that runs entirely on green energy is the most meaningful next step I can imagine.

As Senior Architect and Product Owner at KOMBIT, I own the architecture roadmap and product direction for a portfolio of shared national systems used by Danish municipalities. The landscape spans four suppliers, so much of my work is building consensus: defining integration and identity architecture on national standards, running governance forums, and turning the target state into steps teams can deliver without disrupting live operations.

I have also pushed KOMBIT towards data-driven decisions. By implementing data quality controls for the national Indexes, invalid data submissions have been cut by 25% in early results, and I introduced usage monitoring across all six systems in the portfolio. Building on this, I wrote a discussion paper recommending a central data platform, so municipalities would no longer need to pay suppliers to extract data they already own. I also co-authored the long-term strategy for the six shared national systems, setting direction for our development team in Prague, and contributed to the re-tendering of a new application development contract.

Before KOMBIT I worked hands-on as a DevOps engineer at Demant, where FinOps work cut Azure costs by roughly USD 80,000 per month; as a solution architect and product owner for the national NemLog-in solution at NNIT; and as a solution architect at QualiWare. That background keeps my recommendations grounded in what teams and suppliers can realistically build and run.

The job description – target architectures, decision forums and guiding investment decisions with senior stakeholders – matches this experience closely, and I am eager to grow into Ørsted's broader scope in data, AI and enterprise platforms. I am comfortable with regular office collaboration in Gentofte and would welcome a conversation.

Kind regards

Christoffer Dahl Rexen
